Abstract: Language endangerment is a major challenge to linguistic diversity in Central Asia. The region contains numerous minority and smaller languages whose vitality is affected by language shift, weakening intergenerational transmission, restricted functional domains, limited educational resources, and insufficient digital representation. This article examines the principal factors contributing to language endangerment in Central Asia and identifies the most effective strategies for language preservation. Particular attention is given to intergenerational transmission, multilingual education, language documentation, community participation, and digital technologies. The study demonstrates that sustainable preservation depends primarily on maintaining the transmission of endangered languages to younger generations while simultaneously expanding their educational, cultural, and digital functions.

Keywords: language endangerment, language preservation, Central Asia, language shift, minority languages, revitalization, language documentation, intergenerational transmission.

Introduction

Language represents an essential component of cultural identity and functions as a mechanism for transmitting collective knowledge, traditions, oral heritage, and cultural values. Consequently, the disappearance of a language means the loss of a distinctive linguistic and cultural system. UNESCO identifies intergenerational transmission, number of speakers, domains of use, educational opportunities, and community attitudes as important indicators of language vitality.[1]

Central Asia is characterized by significant linguistic diversity. Alongside the major national languages, the region is home to numerous smaller and minority languages. Some of these languages have experienced a decline in active use because of language shift and the growing dominance of other languages in education, employment, media, and public communication.[2]

Language endangerment is most clearly manifested when younger generations stop acquiring and using their ancestral language. Fishman considers intergenerational transmission within the family and community to be the fundamental condition for maintaining a threatened language.[3] Therefore, the preservation of endangered languages requires not only linguistic documentation but also the creation of social and educational conditions that encourage their continued use. This article focuses on the main causes of language endangerment in Central Asia and the principal strategies for preserving and revitalizing endangered languages.

Discussion

Main Factors of Language Endangerment

The most significant factor in language endangerment is the weakening of intergenerational transmission. When parents communicate with children primarily in a socially dominant language, children may understand the minority language but fail to develop active proficiency in it. As this pattern continues, the number of fluent young speakers decreases and the language becomes concentrated among older generations.[3] Another important factor is language shift. Speakers may gradually replace their heritage language with another language in education, professional communication, public life, media, and digital environments. A minority language may consequently remain limited to family or traditional contexts. Elnazarov notes that several Central Asian languages face vulnerability because of demographic changes, language shift, and the increasing functional importance of dominant languages.[2]

The restriction of functional domains further accelerates language decline. A language that is used only in informal family communication has fewer opportunities for development than a language used in education, literature, media, cultural institutions, and digital communication. The reduction of domains also affects the vocabulary and communicative capacity of the language. A further challenge is the limited availability of educational and linguistic resources. Small language communities may lack textbooks, dictionaries, trained teachers, standardized educational materials, and digital resources. Without these resources, the language has difficulty functioning effectively in formal education and modern communication.

Intergenerational Transmission as the Main Preservation Mechanism

The preservation of an endangered language begins with its transmission to children. Even highly developed institutional programs cannot compensate fully for the absence of natural family transmission. For this reason, language revitalization should prioritize the use of the heritage language in everyday family communication.[1] Parents and grandparents have a particularly important role because they possess linguistic knowledge that may not be available in formal educational institutions. Regular communication, storytelling, traditional narratives, songs, and everyday interaction can maintain children's active competence. The aim should not be to replace dominant languages but to promote additive multilingualism, in which children acquire the national or international languages required for wider communication while simultaneously maintaining their heritage language.

Education and Language Preservation

Education is one of the most effective institutional mechanisms for strengthening endangered languages. The presence of a language in educational settings increases its functional value and provides opportunities for systematic literacy development. According to UNESCO, endangered-language education requires appropriate teaching materials, trained teachers, literacy resources, and community involvement.[1] In Central Asia, relevant measures may include bilingual education, optional heritage-language courses, children's literature, local-language textbooks, and electronic learning resources. Educational programs are particularly important for younger generations because they can connect traditional linguistic knowledge with contemporary forms of learning. When children encounter their

language in textbooks, classrooms, literature, and digital educational materials, its status as a functioning language is strengthened. However, education should complement rather than replace family transmission. A language taught only as a school subject may not achieve long-term vitality if it is absent from everyday communication.

Language Documentation

Language documentation is an essential scientific and practical component of preservation. It involves recording and analyzing vocabulary, grammar, pronunciation, oral narratives, songs, conversations, and other forms of natural language use. Himmelmann emphasizes that language documentation provides a systematic record of linguistic practices and creates resources for future research and revitalization.[4] This is particularly important for Central Asian languages with small or aging speaker populations. Modern documentation should include audio and video recordings, electronic dictionaries, grammatical descriptions, oral-history collections, and digital archives. Such materials can subsequently be transformed into textbooks, dictionaries, language-learning resources, and cultural archives.

Nevertheless, documentation alone does not guarantee language survival. Its principal value increases when documented materials are actively used by speakers and incorporated into educational and revitalization programs.

Digital Technologies and Language Preservation

Digital technologies have created new opportunities for endangered languages. Contemporary language use increasingly takes place online, particularly among younger generations. Therefore, the absence of an endangered language from digital communication can accelerate its marginalization. Digital preservation may involve electronic dictionaries, online courses, digital libraries, social-media content, podcasts, video materials, and searchable linguistic corpora. UNESCO recognizes digital initiatives as an important means of documenting, teaching, and promoting endangered languages.[5]

For Central Asian languages, digital resources can also provide opportunities for geographically dispersed speakers to communicate with one another. Young people can participate directly in creating digital content in their heritage languages, thereby linking traditional linguistic knowledge with contemporary communication.

Community Participation

Language preservation is most effective when linguistic communities actively participate in the process. Researchers and institutions can provide scientific and technical support, but speakers themselves should determine the priorities and practical needs of preservation programs. Community-based activities such as language clubs, storytelling, children's reading groups, oral-history projects, and intergenerational cultural activities can strengthen regular language use. Such initiatives are particularly valuable because they create natural communicative environments rather than treating the language exclusively as an academic subject.

Community participation also contributes to the transmission of cultural knowledge embedded in language. Thus, preservation should focus simultaneously on linguistic competence and opportunities for meaningful language use.

Conclusion

Language endangerment in Central Asia is primarily associated with weakening intergenerational transmission, language shift, restricted functional domains, limited

educational resources, insufficient documentation, and inadequate digital presence. Among these factors, the decline of transmission from parents to children represents the most serious threat to long-term language vitality. Effective preservation therefore requires an integrated approach. The family should remain the primary environment for natural language transmission, while schools should provide literacy and structured educational support. Systematic documentation should preserve linguistic knowledge and create resources for future revitalization. Digital technologies should expand the presence of endangered languages in contemporary communication, and community participation should ensure that preservation programs correspond to the real needs of speakers. The central principle of language preservation is that an endangered language must remain a living means of communication, rather than existing only in archives or cultural records. Its long-term survival depends on the ability of younger generations to acquire, use, and transmit it. Therefore, strengthening intergenerational transmission, expanding educational and digital domains, and developing community-based preservation mechanisms are the most important strategies for maintaining the linguistic diversity of Central Asia.
