Abstract. The transformation of contemporary education requires primary education institutions to adopt innovative approaches to managing pedagogical staff. Traditional administrative models based primarily on hierarchical control, formal reporting, and standardized supervision are increasingly insufficient for developing teacher professionalism and ensuring sustainable educational quality. This article examines innovative methods of managing pedagogical staff in primary education institutions and develops a conceptual framework for their systematic implementation. The study focuses on distributed leadership, professional learning communities, mentoring and coaching, digital staff management, competency-based performance management, collaborative decision-making, and data-informed professional development. The analysis demonstrates that innovative staff management should shift from administrative control toward professional empowerment, continuous learning, collaboration, and evidence-based improvement. The proposed model integrates staff needs assessment, competency diagnostics, individualized professional development, collaborative planning, digital monitoring, feedback, and evaluation into a continuous management cycle. The article argues that effective implementation of innovative staff management requires strong leadership, organizational trust, digital infrastructure, professional autonomy, transparent evaluation mechanisms, and institutional support. The proposed approach can contribute to strengthening teacher motivation, improving professional competencies, enhancing collaboration, and creating sustainable conditions for improving the quality of primary education.

Keywords: primary education, pedagogical staff, innovative management, teacher leadership, mentoring, coaching, professional learning communities, digital management.

Introduction. The quality of primary education depends significantly on the professional capacity, motivation, collaboration, and continuous development of teachers. In contemporary educational systems, teachers are expected not only to transmit knowledge but also to design student-centered learning environments, use innovative pedagogies, integrate digital technologies, collaborate with colleagues, respond to diverse learner needs, and participate in school improvement processes. Consequently, the management of pedagogical staff has become an important strategic dimension of educational leadership. Traditional personnel management in educational institutions has often emphasized administrative

supervision, workload distribution, attendance control, formal reporting, and compliance with established procedures. Although these functions remain necessary, they are insufficient for developing a modern professional teaching workforce. Contemporary school management increasingly requires approaches that empower teachers, support professional autonomy, encourage collaboration, and connect individual professional development with institutional priorities. The OECD emphasizes that effective education leaders establish direction, build trust, improve teaching and learning conditions, redesign leadership roles, and strengthen collaboration within schools. In addition, OECD research highlights professional learning and development as a career-long process that may include formal courses, mentoring, supervision, workshops, online learning, joint problem-solving, reflection, and sharing of professional expertise. The importance of collaborative and distributed approaches is also reflected in international evidence. OECD research indicates that instructional leadership is associated with stronger teacher collaboration, while distributed leadership can increase the involvement of different stakeholders in school decision-making. UNESCO's Global Education Monitoring Report 2024/5 similarly identifies four important dimensions of educational leadership: setting expectations, focusing on learning, fostering collaboration, and developing people. Therefore, the management of pedagogical staff in primary education should be understood not simply as an administrative function but as a multidimensional process aimed at developing human capital, professional collaboration, innovation, and educational quality. The purpose of this article is to analyze innovative methods of managing pedagogical staff in primary education institutions and to propose a conceptual management model based on professional development, distributed leadership, digital technologies, collaboration, and evidence-based decision-making.

Literature Review. The theoretical foundations of innovative pedagogical staff management are associated with educational leadership, human resource management, professional learning, organizational development, and teacher leadership. Educational leadership research increasingly emphasizes the transition from hierarchical leadership toward distributed and instructional leadership. In this model, school improvement is not the exclusive responsibility of the principal. Teachers, department coordinators, mentors, and other members of the school community can participate in decision-making and leadership activities. OECD research demonstrates that distributed leadership can contribute to a shared sense of purpose by involving staff in school-level decision-making. More recent OECD TALIS 2024 evidence also reports substantial teacher participation in leading new initiatives, professional learning communities, and collaborative activities across education systems. Another important direction is the development of professional learning communities (PLCs). A professional learning community creates conditions in which teachers collaboratively analyze educational problems, exchange experience, observe professional practices, and develop solutions. OECD evidence emphasizes that school-based professional development can contribute to a culture of improvement and a shared vision of learning among teachers and school leaders. Mentoring and instructional coaching are also increasingly important. These approaches allow experienced teachers and school leaders to provide structured professional support to colleagues. OECD research identifies mentoring, instructional coaching, and professional learning communities as important mechanisms for continuous improvement in teaching quality. Digitalization has further expanded the possibilities for staff

management. Digital platforms can facilitate professional communication, performance monitoring, individualized professional development plans, electronic portfolios, collaborative planning, and knowledge sharing. At the same time, innovative staff management should not be reduced to the introduction of digital tools. OECD research emphasizes that effective leadership requires a combination of management knowledge, pedagogical expertise, professional learning, and the ability to apply these competencies within the complex environment of schools. Thus, the literature suggests that innovative pedagogical staff management should combine organizational, professional, technological, and human dimensions.

Discussion. The findings of the study demonstrate that innovative management of pedagogical staff in primary education institutions should be based on a transition from predominantly administrative and control-oriented approaches toward developmental, collaborative, and evidence-based management. The analysis indicates that teacher professional development, distributed leadership, mentoring, coaching, digital management, and competency-based evaluation are interconnected elements of an effective staff management system. One of the most important findings is the role of distributed leadership in improving the involvement of teachers in institutional decision-making. In traditional management models, strategic decisions are often concentrated at the administrative level, while teachers primarily perform implementation functions. An innovative management approach, in contrast, recognizes teachers as active participants in organizational development. This approach creates opportunities for teachers to initiate educational projects, coordinate methodological activities, participate in professional learning communities, and contribute to school improvement strategies. OECD research similarly emphasizes that teacher participation in decision-making and leadership activities can contribute to collaborative professional cultures and shared responsibility for school development. Another important aspect identified in the study is the significance of professional learning communities (PLCs). The results suggest that professional development becomes more sustainable when it is embedded in everyday professional practice. Instead of relying exclusively on short-term training courses, teachers can continuously exchange experiences, analyze student learning outcomes, discuss classroom challenges, observe colleagues' lessons, and jointly develop solutions. Such collaboration contributes to the formation of a culture of continuous professional learning. OECD research also identifies collaboration and school-based professional learning as important mechanisms for strengthening teaching quality and organizational capacity.

The findings further demonstrate the importance of mentoring and instructional coaching in managing pedagogical staff. Newly appointed teachers frequently require support in classroom management, lesson planning, assessment, communication with parents, and the practical application of innovative pedagogical technologies. A structured mentoring system enables experienced teachers to transfer professional knowledge and practical experience to less experienced colleagues. At the same time, instructional coaching provides more individualized support through classroom observation, professional feedback, reflection, and targeted improvement strategies. Therefore, mentoring and coaching should be viewed not merely as support mechanisms but as strategic components of human resource development in primary education. The study also highlights the importance of competency-based staff

management. Traditional personnel management frequently emphasizes formal qualifications, length of service, and administrative performance indicators. However, the professional effectiveness of a primary school teacher depends on a broader set of competencies, including pedagogical, communicative, digital, assessment, leadership, innovative, reflective, and collaborative competencies. A competency-based management model allows school leaders to identify individual strengths and professional development needs and to design differentiated development plans. This approach is consistent with the broader international shift toward continuous professional learning and teacher career development. An additional finding concerns the role of digital technologies in pedagogical staff management. Digital platforms can facilitate professional communication, electronic portfolios, professional development tracking, collaborative planning, and feedback processes. Digital systems also make it possible to organize and analyze professional information more efficiently. Nevertheless, digitalization should not be interpreted as a replacement for human interaction. Rather, digital tools should support communication, professional learning, and evidence-based decision-making. The effectiveness of digital staff management therefore depends on teachers' and school leaders' digital competencies as well as the availability of appropriate technological infrastructure. The findings also suggest that professional autonomy and accountability should be balanced. Excessive administrative control can restrict teacher creativity and initiative, whereas complete absence of accountability may make it difficult to maintain common institutional standards. An effective management model should therefore establish clear expectations while providing teachers with sufficient professional autonomy to determine how those expectations can be achieved.

The relationship between the main innovative management methods can be represented as follows:

Distributed Leadership → Teacher Participation → Professional Collaboration → Continuous Learning → Innovation → Improved Teaching Practice → Educational Quality

This relationship indicates that innovative staff management should be understood as an integrated system rather than a collection of separate administrative techniques. Distributed leadership creates opportunities for participation; professional learning communities facilitate collaboration; mentoring and coaching provide individualized support; digital technologies strengthen communication and monitoring; and competency-based management connects professional development with institutional objectives. At the same time, several implementation challenges should be acknowledged. These include limited digital infrastructure, insufficient data literacy, lack of time for collaborative professional learning, resistance to organizational change, unequal access to professional development opportunities, and insufficient preparation of school leaders for innovative human resource management. Addressing these challenges requires institutional planning, leadership development, appropriate resource allocation, and sustained professional support. Overall, the discussion confirms that innovative management of pedagogical staff in primary education should be oriented toward professional empowerment, collaboration, continuous development, innovation, and evidence-based improvement rather than merely administrative supervision. The most important implication is that teachers should be treated as active professional partners in school development. When teachers are provided with opportunities for leadership, professional learning, collaboration, reflection, and innovation, staff management can become

an important mechanism for strengthening the overall quality and sustainability of primary education.

Conclusion. Innovative management of pedagogical staff is becoming an increasingly important component of effective primary education management. The analysis demonstrates that contemporary staff management should move beyond administrative control and incorporate professional empowerment, distributed leadership, collaborative learning, mentoring, coaching, digital technologies, competency-based assessment, and data-informed decision-making. The proposed model emphasizes eight interconnected stages: professional diagnosis, strategic planning, individualized development, collaborative learning, innovation implementation, monitoring, feedback, and continuous improvement. The effectiveness of this approach depends on several organizational conditions, including supportive leadership, professional trust, adequate digital infrastructure, teacher autonomy, continuous professional learning, transparent evaluation, and opportunities for collaborative decision-making. In primary education institutions, teachers should be regarded not only as employees who implement predetermined educational programs but also as professional actors capable of initiating innovation, contributing to institutional decision-making, mentoring colleagues, and participating in school development. International evidence supports the importance of collaboration, distributed leadership, professional learning communities, mentoring, and continuous professional development in strengthening school capacity. Therefore, innovative pedagogical staff management can be conceptualized as a development-oriented management system in which leadership, professional learning, collaboration, digitalization, and continuous feedback are integrated into a unified organizational mechanism. Such an approach creates conditions for strengthening teacher professionalism and supporting sustainable improvement in the quality of primary education.
