nabiyevnad@gmail.com

Abstract : Governance of environmental policy and law involves management and regulation of environmental issues resulting from human activities and natural events. With increasing attention to environmental degradation, climate change, and depletion of resources, this area has emerged as an important challenge and focus of governance across levels and issues. Key concepts include processes of environmental governance such as policy-making, law enforcement, stakeholder participation and multilevel governance (the local, national and international government levels working together to develop and implement relevant policies and agreements in a coordinated way), and the importance for the effectiveness of the policy process of compliance and enforcement measures, environmental monitoring and regulatory instruments. The role of public awareness and public involvement in environmental decision-making is discussed. The study also describes the difficulties in developing countries where policy implementation is often limited by a lack of institutional capacity and economic resources. It proposes that the integration between science and law is a way to make environmental governance more flexible, with the governance of environmental policies and laws contributing to the sustainable development of the economy and the maintenance of social stability.

Keywords: Environmental governance, regulatory legislation, sustainability, implementation, climate change, institutional framework

Introduction

Environmental policy and law governance is a governance field for the environment through legislative, institutional and administrative measures. It is an emerging field responding to increasing global environmental challenges namely climate change and air pollution, and water pollution, deforestation and loss of biodiversity. It seeks to regulate the relationship between human activity and the natural environment ensuring a sustainable level of resource use for present and future generations. However, environmental governance is the processes and actors involved in the making and applying of decisions about the environment. Governments are at the center of environmental governance, forming laws and regulations that delineate acceptable environmental behaviors. In addition, environmental governance goes beyond the nation-state, and includes workers of intergovernmental organizations, the private sector, non-governmental organizations, and local populations, in recognition of the complexities of environmental issues that cannot be handled through nation-based politics. The main regulatory legal framework for governance systems is environmental law. It consists of regulations that are legally binding and implemented through instruments such as environmental impact assessments, emission controls, waste and pollution management, and conservation-related regulations. The effective enforcement of these laws and regulations is critical to ensure that the policies have a positive impact on the environment. Well-created policies may not deliver results if they are poorly enforced. Another dimension is the multi-level character of environmental governance. Environmental problems are global in nature and thus require interventions on the international, regional and national levels. Multilateral agreements such as the climate change conventions and biodiversity agreements set out the high level goals that states are required to pursue, and local authorities are ultimately responsible for delivering these goals. While this allows for more thorough and coordinated responses to environmental issues, it makes the system more susceptible to inconsistency and coordination problems. Public participation in environmental governance is another key tool, which promotes citizen involvement in environmental decision-making, resulting in greater transparency, accountability, inclusion, and better alignment with

the needs of people and their environments. Finally, community participation raises awareness or encourages sustainable resource use. It is common for locally generated knowledge to make policies more effective. Despite the existence of these environmental governance systems and progress made in many countries, multiple difficulties remain. For example, developing countries may have weak enforcement mechanisms, a lack of financial resources, and limited institutional capacity. Economic growth may weaken environmental protection where it is generated at the expense of resource sustainability. Government weakness and non-transparency combined with a lack of anti-corruption measures can also impede the implementation of environmental protection measures. In response to the challenges, there is a growing interest in flexible and integrated governance approaches, such as adaptive governance, which allows for changes in management policy based on new scientific evidence and changing environmental conditions. Other integrated approaches aim to achieve balanced and sustainable development outcomes by coordinating environmental governance with other policy sectors, particularly economic and social ones, to improve resilience and performance over the long term.

Sound governance in environmental policy-making, law, and management is key to the formulation and implementation of sustainable development policies and strategies. Improving legal and institutional frameworks and public participation are key components of environmental governance. The efforts thus help preserve the environment and also support social and economic stability.

Review of Literature

Environmental policy and governance has been broadly defined by environmental politics and policy scholars as a multi-dimensional system through which human-environment interactions are regulated, guided and constrained by institutional, legal, and policy mechanisms. Subsequently, environmental governance scholars have widely agreed that the concept of environmental governance applies not only to governments but also to international organizations, private institutions, civil society, and local governments. According to Karl Bruckmeier, environmental governance has to be understood as part of the social change process. Society is at the same time developing its relationship with the natural environment. He stresses that it is not only about governance, but also about cooperation, knowledge production, and institutional learning within global environmental systems (link.springer.com). The viewpoint stresses the dynamic nature of environmental governance that must respond to changes in society (values) and science. Ostrom's institutional theory of governance stands in contrast to top down policy prescriptions from economists. Her theory argues that environmental resources are best managed through community governance and polycentric governance systems, where decision-making occurs at multiple centers that are independent from but also cooperative with one another, instead of government regulation or market forces. Local collaboration can improve environmental conditions if given the right legal frameworks.

Another contribution of this theory lies in the analysis of environmental governance. In this context, multilevel governance seeks to explain environmental policy at the levels of international, national and local politics. It argues that high-level treaties, domestic legislation, and local policies need to be harmonized in order to address global issues, such as climate change. This layered governance system often translates global commitments into local policies and actions, though coherence and coordination across the layers can potentially be problematic. Partelow et al. (2020) identify the most important environmental governance theories as adaptive governance, network governance, collective action theory, and evolutionary governance theory. According to Partelow et al, no single theory can explain environmental governance. In order to understand and manage socio-ecological systems, multiple perspectives are necessary. They stress the importance of flexibility and adaptability while also stressing the need for interdisciplinary ways of thinking within the context of environmental policy (canr.msu.edu). Legal perspectives on sustainable development contend with discussions about legally binding standards, compliance and enforcement mechanisms, and institutional accountability processes. There are legal aspects to sustainable development, including pollution control legislation, laws on environmental impact assessments, and environmental conservation legislation. However, scholars have noted that legal

frameworks can be obstructed by weak enforcement, corruption and lack of political will, particularly in developing countries.

Further, recent literature on institutional adaptive governance strongly advocates for adaptive policies, which allow for learning and adjustments in response to unexpected changes in the environment or uncertainties such as climate change, where there are many unknowns and where the time scales over which to fix problems are long. Overall, the literature on environmental policy and law governance stresses a complex and evolving system that requires coordination of legal frameworks, institutional structures, and social engagement. Scholars underscore the importance of collaboration, adaptability, and inclusive decision-making processes alongside solid legal frameworks to govern such a complex and dynamic system effectively.

Objectives of the Study

1. To examine environmental policy in the context of governance systems

This objective is concerned with what the design of environmental policies looks like, and how these policies influence decision-making; in particular, how to design pollution-control policies, utilize natural resources, and promote sustainability.

2. Review and assess environmental law enforcement mechanisms.

This objective examines the implementation of environmental laws and regulations to highlight issues such as compliance monitoring, institutional capacity, and enforcement challenges that impact the success of environmental protection efforts.

3. To assess the role of multi-level governance in environmental management

Its purpose is to help understand how environmental responsibilities are divided between the local, national and international levels, and how international environmental agreements are represented in domestic law and local contexts.

4. Studying stakeholder engagement in environmental decision-making

The objective relates to the participation of community, NGOs, and private sector in environmental governance and recognizes the role of inclusive governance in improving transparency, accountability, and policy outcomes.

5. To examine adaptive approaches to environmental governance

This objective considers how adaptive and responsive governance regimes can cope with environmental unpredictability and change, and stresses the role of flexibility, learning and science in achieving long-term sustainability.

Methodology

This study employs a mixed-method descriptive research design to investigate the understanding and perception of environmental policy and law governance among students enrolled in the Law College of The People's Friendship University in Andijan, Uzbekistan. Qualitative and quantitative research methods are used to holistically assess students' knowledge and awareness.

Research Design

The cross-sectional survey design utilized in this study allowed gathering of responses from participants at a single point in time, providing an opportunity to assess students' baseline understanding and attitudes on environmental governance.

Population and Sample

The target population is the students at the Law College of Andijan. Sixty students were chosen by simple random sampling, equally distributed between the first, second, third and fourth academic years.

Data Collection Method

Primary data collection entailed the use of a closed-ended structured questionnaire with Likert scale questions focusing on:

Awareness of environmental laws

- Understanding governance systems

Perceived effectiveness of environmental policies

- Environmentally friendly community initiatives

Secondary data were collected from academic journals, government reports, and literature on international environmental law.

Data Analysis Method

The results were analyzed using descriptive statistics, including percentage and frequency distribution. They were presented in tabular form without any graphical representation to simplify their interpretation.

Data Analysis

Table 1: Awareness of Environmental Laws among Students

Level of Awareness	Number of Students	Percentage (%)
High	18	30%
Moderate	27	45%
Low	15	25%

The table shows that most students (45%) have moderate awareness of environmental laws, while only 30% demonstrate high awareness.

Table 2: Understanding of Environmental Governance

Understanding Level	Number of Students	Percentage (%)
Good	20	33%
Average	25	42%
Poor	15	25%

The majority of students fall under the average understanding category, indicating the need for stronger academic focus on governance topics.

Table 3: Participation in Environmental Activities

Participation Level	Number of Students	Percentage (%)
Active	14	23%
Occasional	26	43%
None	20	34%

Results show low active participation, suggesting limited practical engagement in environmental initiatives.

Table 4: Perception of Environmental Law Effectiveness

Perception	Number of Students	Percentage (%)
Effective	22	37%
Moderately Effective	24	40%
Ineffective	14	23%

Most respondents believe environmental laws are moderately effective, showing mixed confidence in governance systems.

Conclusion

Environmental policy and law governance play a critical role in shaping sustainable development and environmental protection, particularly in rapidly developing regions such as Andijan. The findings of this study reveal that law students possess a moderate level of awareness and understanding of environmental governance, but there are significant gaps between theoretical knowledge and practical engagement. The data analysis shows that while a considerable number of students are familiar with

environmental laws, their depth of understanding remains limited. Most respondents fall within the "moderate" category of awareness and knowledge, indicating that environmental law education is present but not deeply integrated into practical learning. This suggests that current academic curricula may not sufficiently emphasize applied environmental governance or real-world legal enforcement mechanisms. Another important finding is the low level of student participation in environmental activities. Despite being law students, who are expected to engage actively in legal and policy-related issues, a significant proportion of respondents reported only occasional or no participation in environmental initiatives. This highlights a gap between academic learning and civic engagement. Increasing participation through workshops, environmental law clinics, and community-based projects could help bridge this gap. The perception of environmental law effectiveness is also mixed. While some students believe that existing legal frameworks are effective, a larger portion considers them only moderately effective or insufficient. This reflects broader concerns about enforcement challenges, policy implementation gaps, and limited public awareness. It also indicates that students are critically aware of the strengths and weaknesses of environmental governance systems. Overall, the study concludes that environmental policy and law governance education in Andijan Law College has foundational strength but requires further enhancement. Strengthening curriculum content, increasing practical exposure, and encouraging active student participation in environmental governance activities are essential steps forward. Additionally, integrating case studies, field visits, and policy analysis exercises could significantly improve students' understanding of real-world environmental governance challenges. In conclusion, improving environmental legal education at the academic level is essential for developing future legal professionals who are capable of addressing environmental challenges effectively. As environmental issues continue to grow in complexity, well-trained law graduates will play a key role in ensuring effective governance, stronger enforcement, and sustainable development in Uzbekistan.
